Focus on

arXiv: arXiv:1308.3655 (JHEP), arXiv:1504.07892 (PRD), arXiv:1509.06313 (PRD), arXiv:1511.01873 (JHEP), arXiv:1605.01129 (PRD)

In collaboration with

G. Palacio, F. von der Pahlen, D. Portillo, A. Rivera, M. Sánchez, O. Zapata (UdeA)

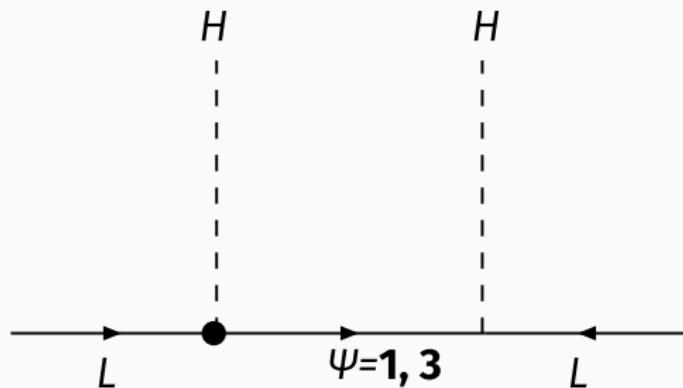

C. Arbeláez (USM), W. Tangarife (Tel Aviv U.), C. Yaguna (Heidelberg, Max Planck Inst.).

Table of Contents

1. General framework
2. Proposal: $pp \rightarrow l^+l^- + E_T^{\text{miss}}$
3. Specific examples
4. Lepton flavor dependence
5. Prospects for run-II
6. Vector-like fermion mediation

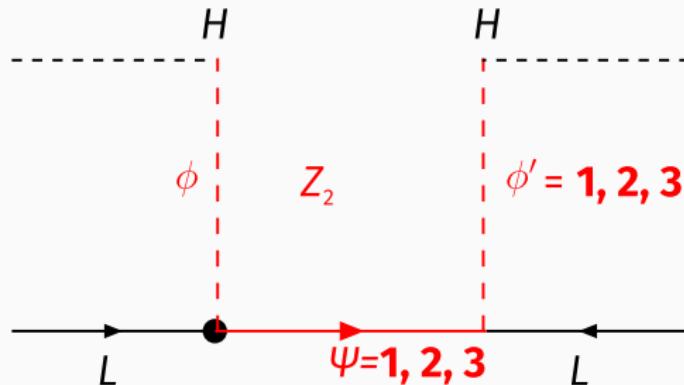

General framework

small neutrino masses

ν -DM models

small neutrino masses $\Leftarrow Z_2 \Rightarrow$ dark matter

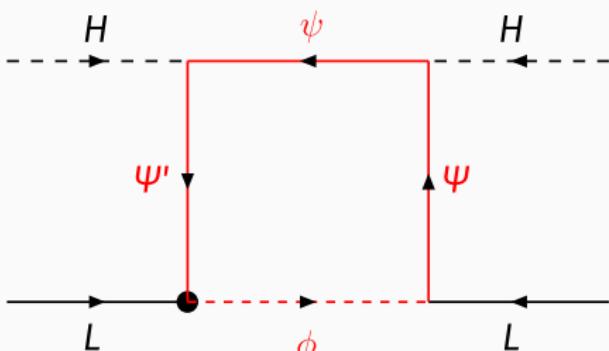

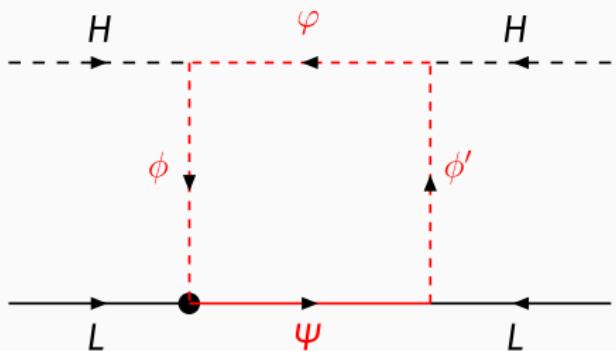

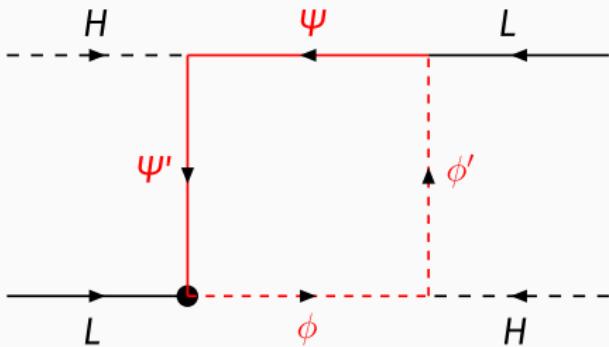

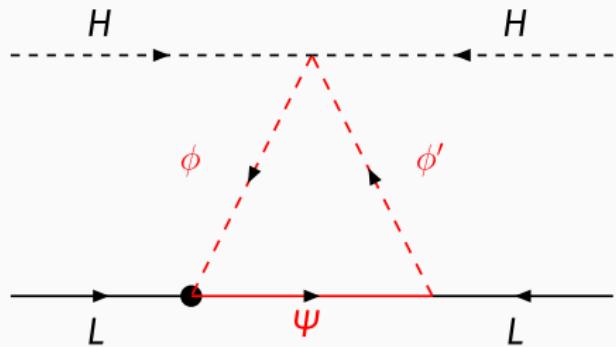

35 non-equivalent dark matter models classified in

D.R., C. Yaguna, O. Zapata, arXiv:1308.3655 (JHEP)

2. Neutrinos talk to a different **Higgs boson**

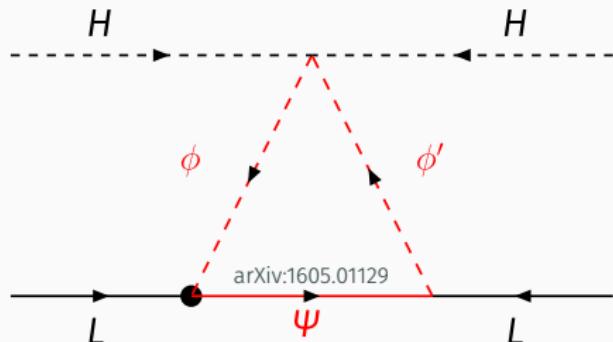

Weinberg operator at one-loop

(Z_2 -odd fields)

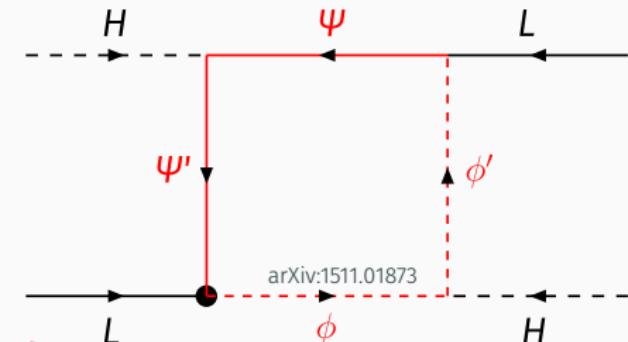

Weinberg operator at one-loop

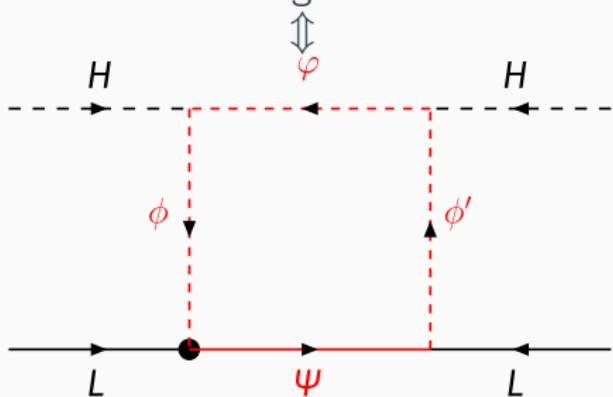

(Z_2 -odd fields)

Wino-like scotogenic model

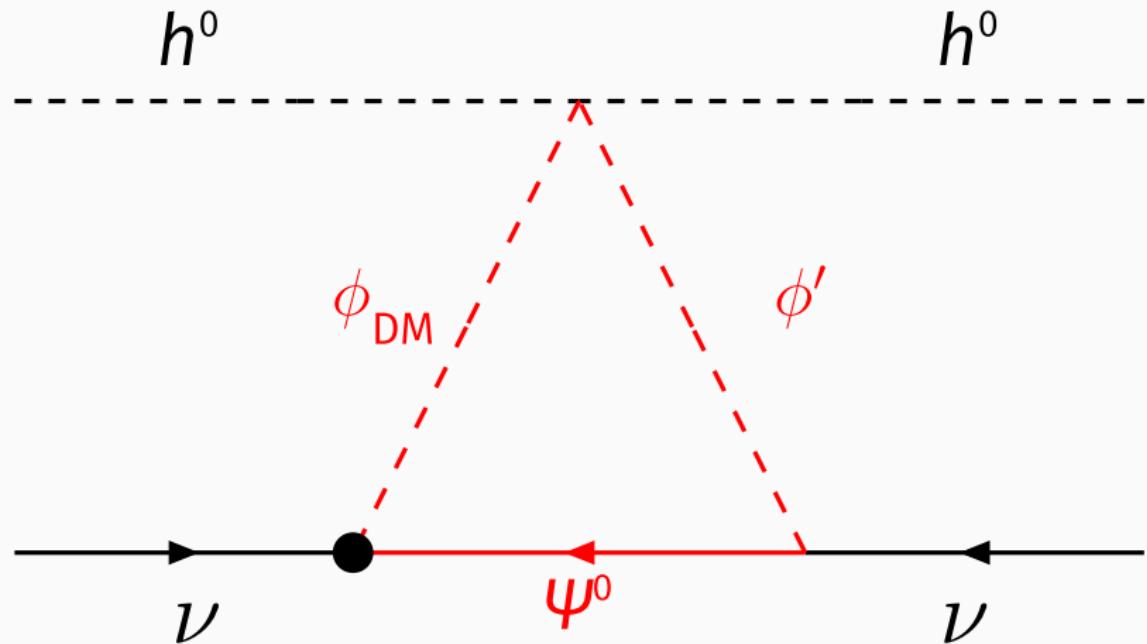

Higgsino-like Zee model

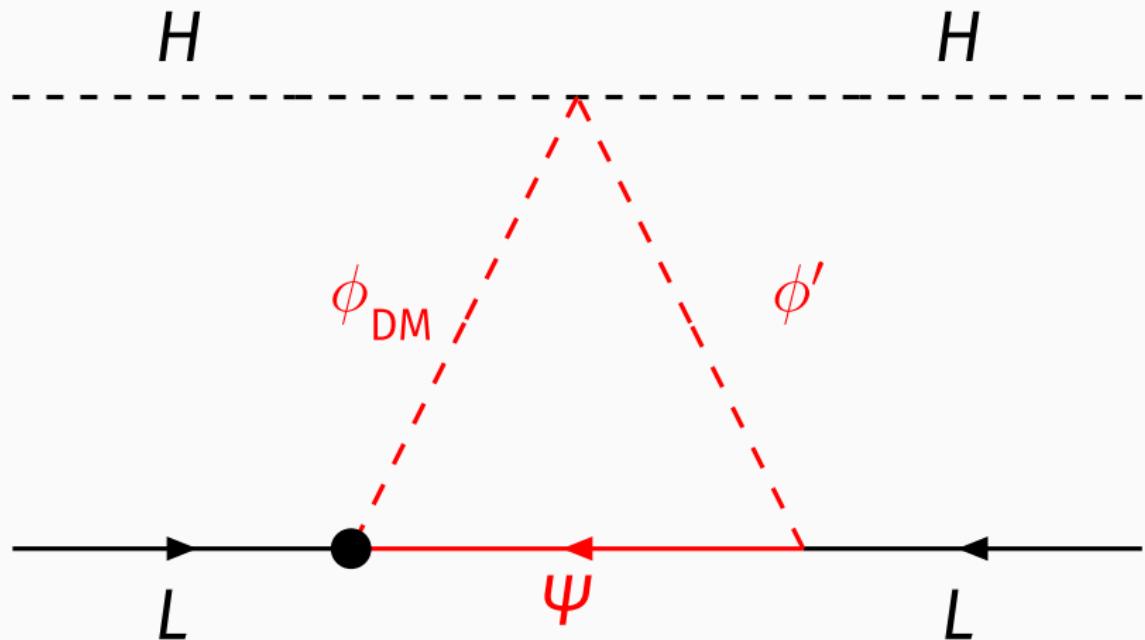

Higgsino-like scotogenic model

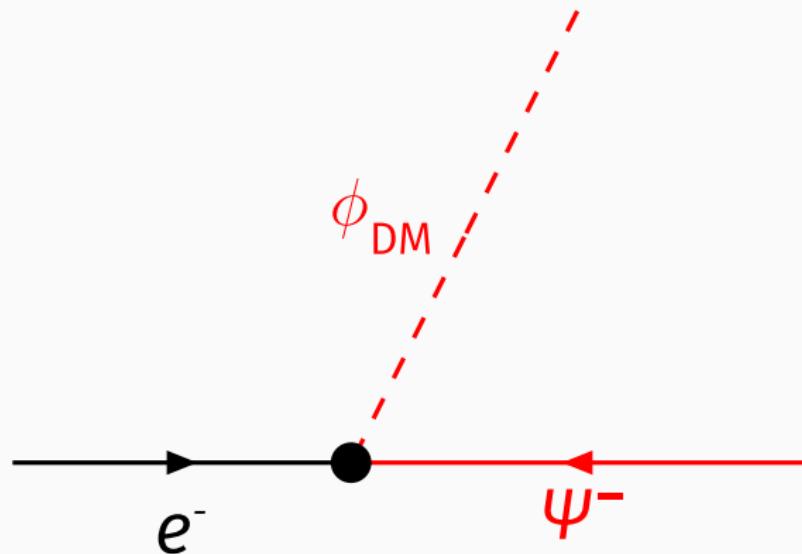

Typical radiative neutrino mass diagram.

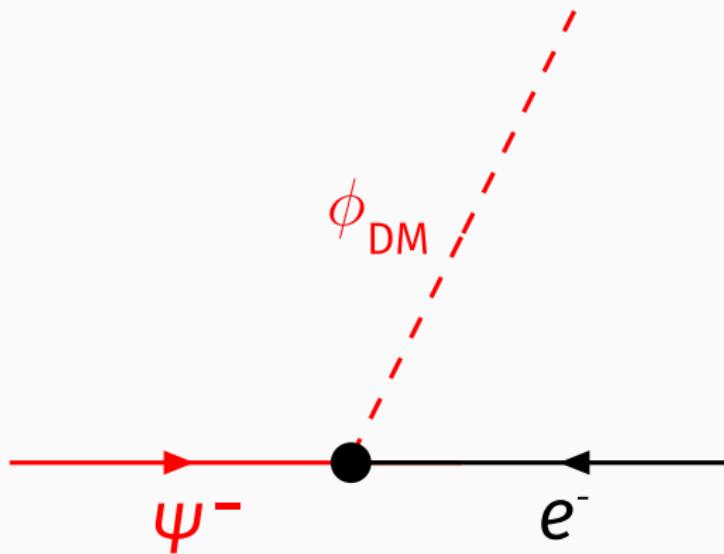

In term of general $SU(2)_L$ multiplets,

may be also contain charged particles,

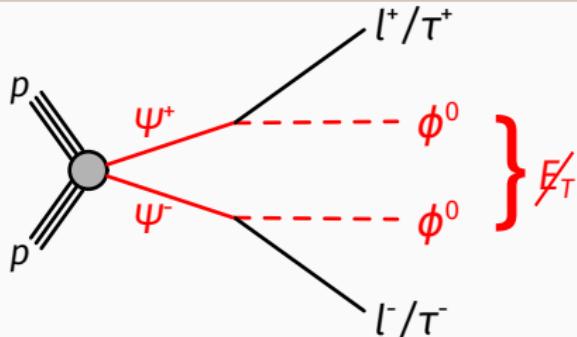

which may decay into the dark matter particle.

Proposal: $pp \rightarrow l^+l^- + E_T^{\text{miss}}$

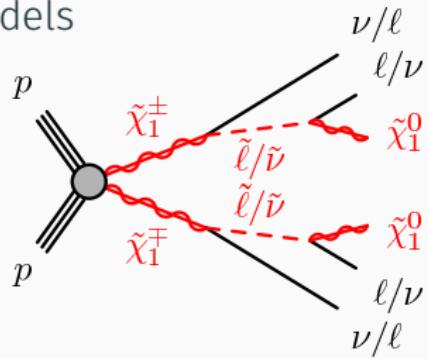

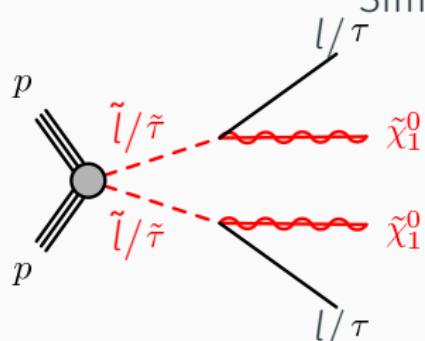

Dilepton plus transverse missing energy signal

SU(2)_L assignments:

$$\Psi = 1, 2(\Psi), 3(\Sigma), \quad \Phi = 1, 2, \text{ with } m_{\text{DM}} \sim m_h/2.$$

Simplified SUSY models

Smaller cross sections.

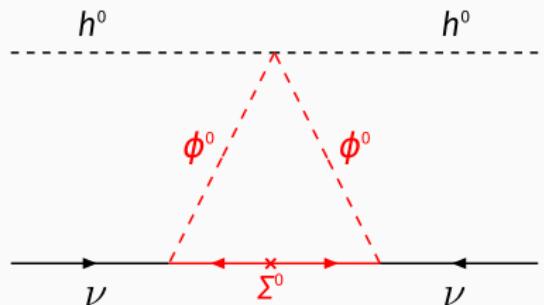

Intermediate states and smaller lepton p_T

Specific examples

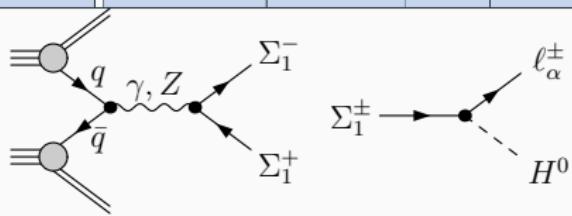

Specific examples

- Wino-like scotogenic models
 - Radiative type-III seesaw: 1605.01129, F. von der Pahlen, G. Palacio, DR, O. Zapata
- Higgsino-like scotogenic models
 1. SDFM with scalars: 1504.07892, DR, *et. al.*
 2. Inert Zee: 1511.01873, R. Longas, D. Portillo, DR, O. Zapata.
 3. Radiative type-II seesaw: 1511.06375, S. Fraser, C. Kownacki, E. Ma, O. Popov
1609.01018, S. Guo, Z. Han, Y. Liao
- Bino-like scotogenic models
 - In progress ...

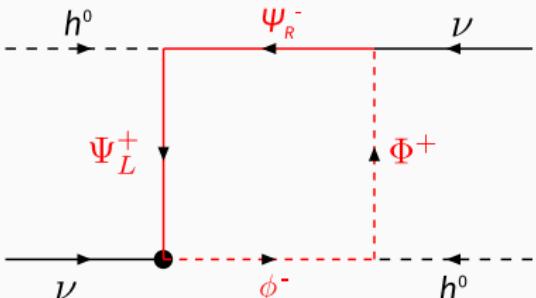

Winno-like scotogenic model

	$SU(2)_L$	$U(1)_Y$	Z_2	S
H	2	1	+	0
Φ	2	1	-	0
L_α	2	-1	+	$1/2$
Σ_k	3	0	-	$1/2$

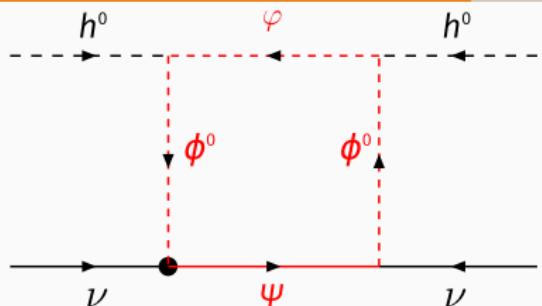

Higgsino-like inert Zee model

	$SU(2)_L$	$U(1)_Y$	Z_2	S
ϕ^-	1	-2	-	0
Φ	2	-	0	-
ψ^-	1	-2	-	0
$\Psi_{L,R}$	2	± 1	-	$1/2$

$$\Sigma^+ \rightarrow \psi^+$$

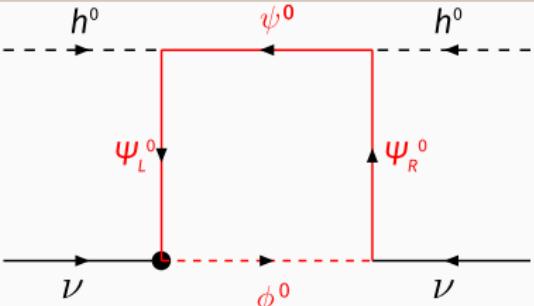

Winno-like scotogenic model

	$SU(2)_L$	$U(1)_Y$	Z_2	S
H	2	1	+	0
Φ	2	1	-	0
L_α	2	-1	+	1/2
Σ_k	3	0	-	1/2

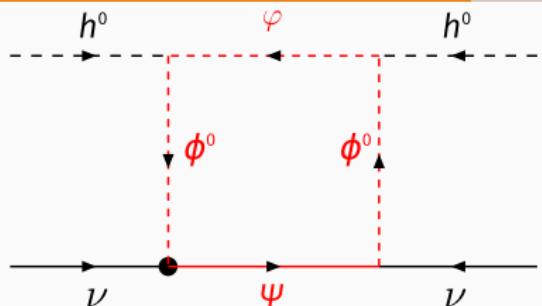

Higgsino-like scotogenic model

	$SU(2)_L$	$U(1)_Y$	Z_2	S
ϕ^-	1	-2	-	0
Φ	2	-	0	-
ψ^-	1	-2	-	0
$\Psi_{L,R}$	2	± 1	-	1/2
ψ	1	0	-	1/2
ϕ	1	0	-	0

$$\Sigma^+ \rightarrow \psi^+$$

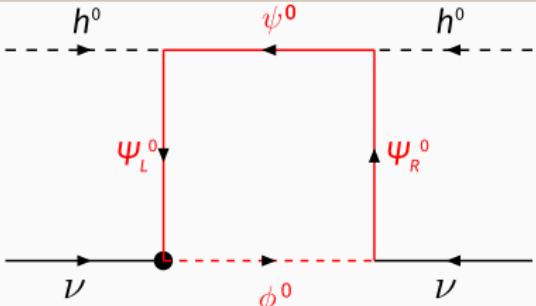

Winno-like scotogenic model

	$SU(2)_L$	$U(1)_Y$	Z_2	S
H	2	1	+	0
Φ	2	1	-	0
L_α	2	-1	+	1/2
Σ_k	3	0	-	1/2

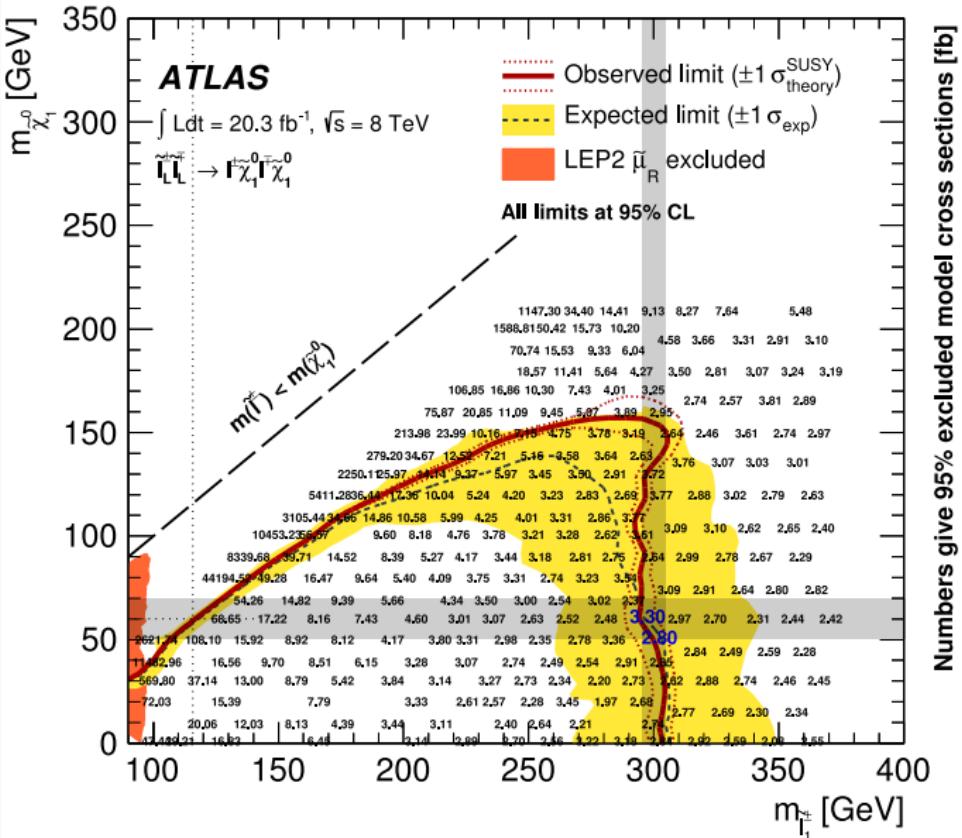

Higgsino-like model

	$SU(2)_L$	$U(1)_Y$	Z_2	S
ϕ^-	1	-2	-	0
Φ	2	-	0	-
ψ^-	1	-2	-	0
$\Psi_{L,R}$	2	± 1	-	1/2
ψ	1	0	-	1/2
ϕ	1	0	-	0

$$\Sigma^+ \rightarrow \psi^+$$

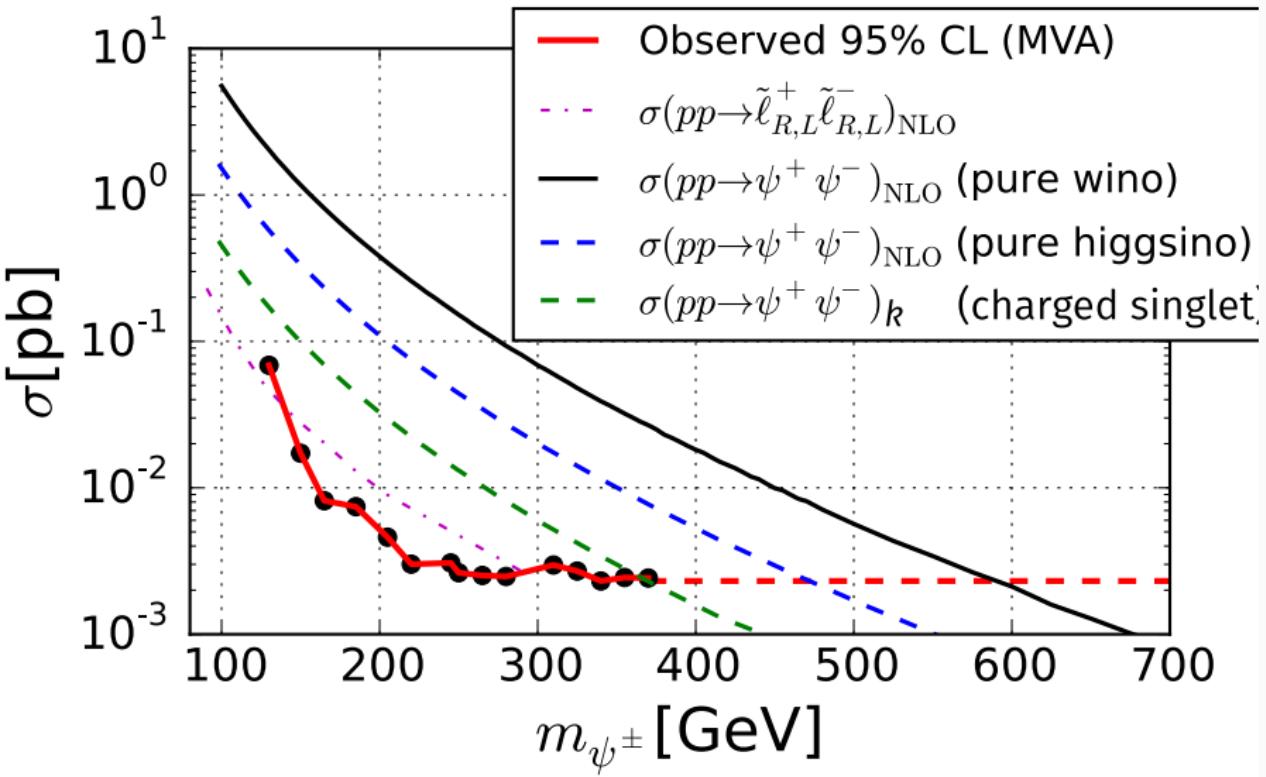

Numbers give 95% excluded model cross sections [fb]

CMS

$> 260 \text{ GeV}$

$m_{\phi^0} = 60 \text{ GeV}$

Lepton flavor dependence

Neutrino masses

$$(\mathcal{M}_\nu)_{\alpha\beta} = \sum_{k=1}^{n_\Sigma} [\textcolor{red}{Y^T \Lambda Y}]_{\alpha\beta}, \quad \alpha, \beta = 1, 2, 3,$$

From neutrino oscillation data, we can get a set of $\textcolor{red}{Y}$ choosing the angles for $\textcolor{red}{R}$, an arbitrary *complex orthogonal matrix*

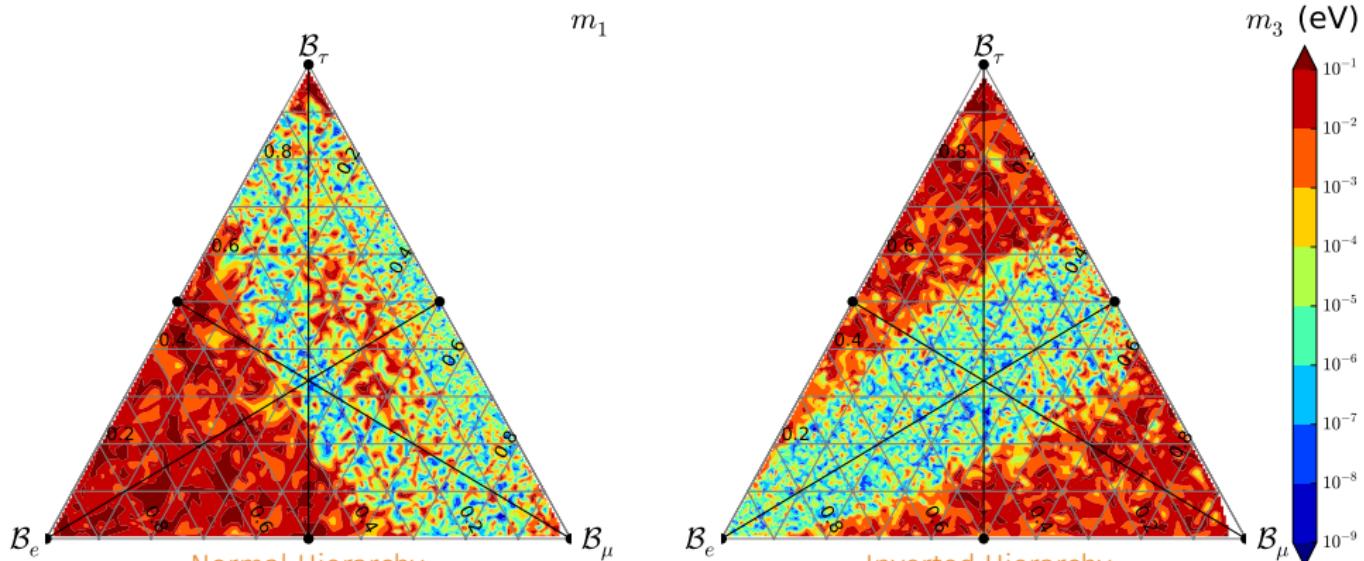

$$\textcolor{red}{Y} = \sqrt{\Lambda}^{-1} \textcolor{red}{R} \operatorname{diag}(\sqrt{m_{\nu_1}}, \sqrt{m_{\nu_2}}, \sqrt{m_{\nu_3}}) U_{\text{PMNS}}^\dagger, \quad (1)$$

$$\hat{Y}_{\alpha} \equiv \hat{Y}_{1\alpha} = Y_{1\alpha} / \sqrt{\sum_{\alpha=e,\mu,\tau} |Y_{1\alpha}|^2} \quad \mathcal{B}_{\alpha} \equiv \operatorname{Br}(\Sigma_1^\pm \rightarrow \ell_{\alpha} H^0) = |\hat{Y}_{\alpha}|^2.$$

Input parameters: 3 complex angles and 1 phase.

Casas-Ibarra parametrization

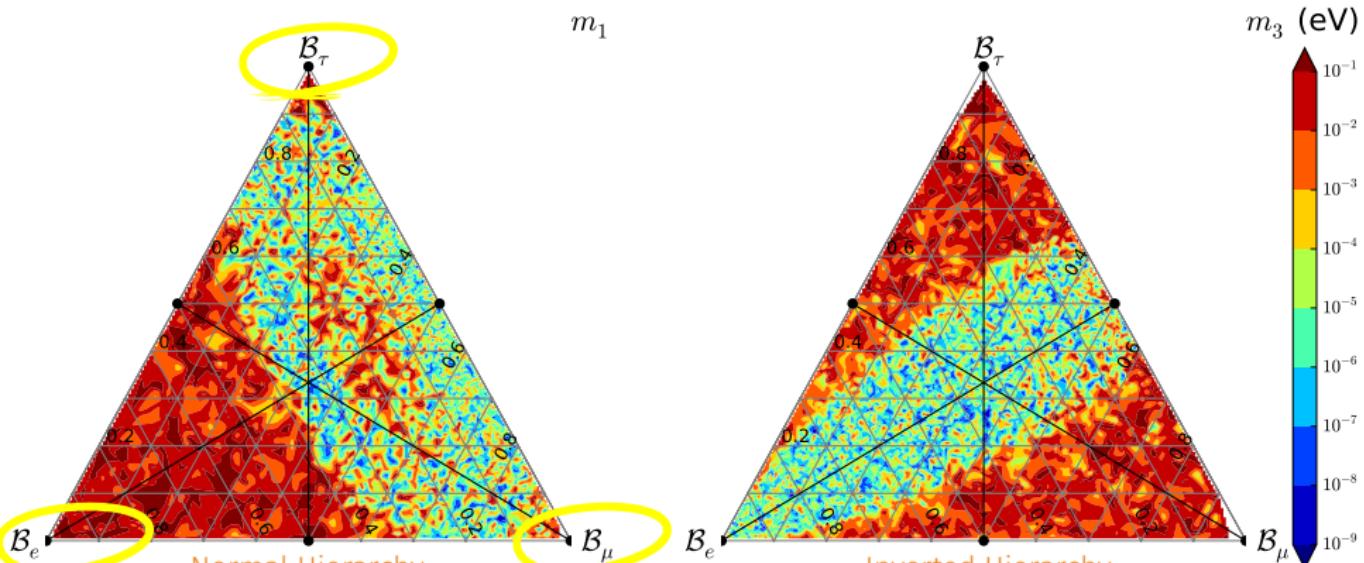

In wino-like scotogenic model (may be in general)

$$\mathcal{B}_l = \mathcal{B} (\Sigma^\pm \rightarrow l^\pm H^0)$$

Casas-Ibarra parametrization

In wino-like scotogenic model (may be in general)

$$\mathcal{B}_l = \mathcal{B} (\Sigma^\pm \rightarrow l^\pm H^0)$$

Exploration of flavor space

Wino-like scotogenic model: Recast for $B_\mu + B_e \gtrsim 0.1$ and

$$m_{H^0} < m_{\Sigma^\pm} = m_{\Sigma^0} < m_{A^0}, m_{H^\pm}$$

Start with Signal regions as in ATLAS-arXiv:1403.5294 for
~~E~~T with e^+e^- , $\mu^+\mu^-$, $e^\pm\mu^\mp$.

checkMATE (CL-calculation)

Combination

Prospects for run-II

Golden EW SUSY channel: trilepton and \not{E}_T

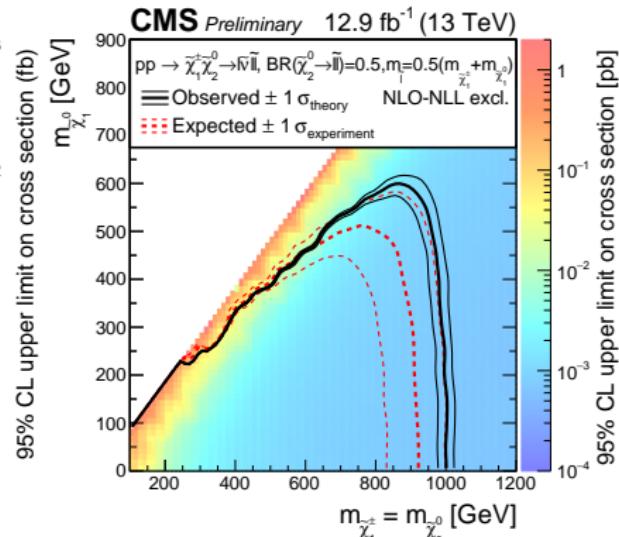

arxiv:1405.7570 (8 TeV)

Improvement by a factor of 1.4

For a similar improvement we could expect exclusions at the level of
900 GeV in the wino-like scotogenic model,

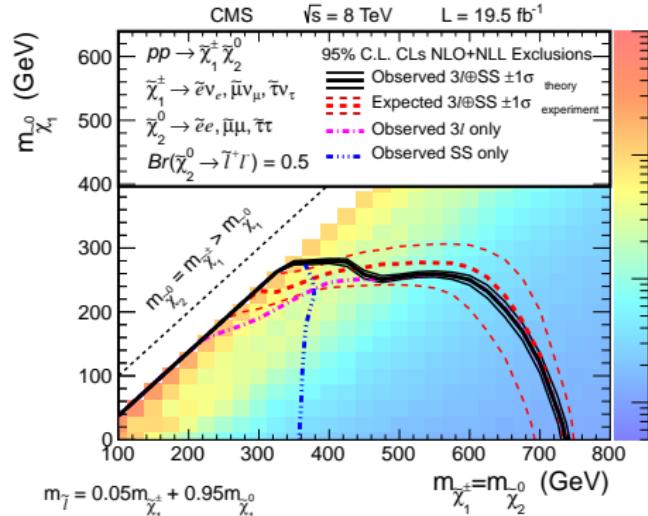

700 GeV in Higgsino-like scotogenic models.

500 GeV in Bino-like scotogenic models.

SUS-16-024 (13 TeV)

Golden EW SUSY channel: trilepton and \not{E}_T

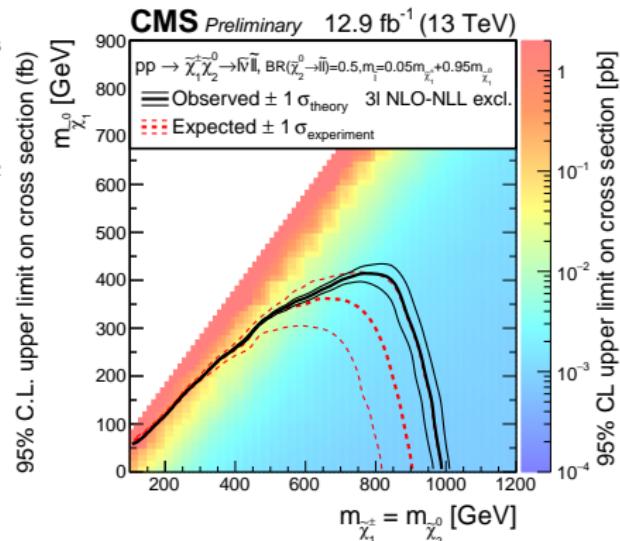

arxiv:1405.7570 (8 TeV)

Improvement by a factor of 1.4

For a similar improvement we could expect exclusions at the level of
900 GeV in the wino-like scotogenic model,

700 GeV in Higgsino-like scotogenic models.

500 GeV in Bino-like scotogenic models.

SUS-16-024 (13 TeV)

Vector-like fermion mediation

Vector-like fermion mediation

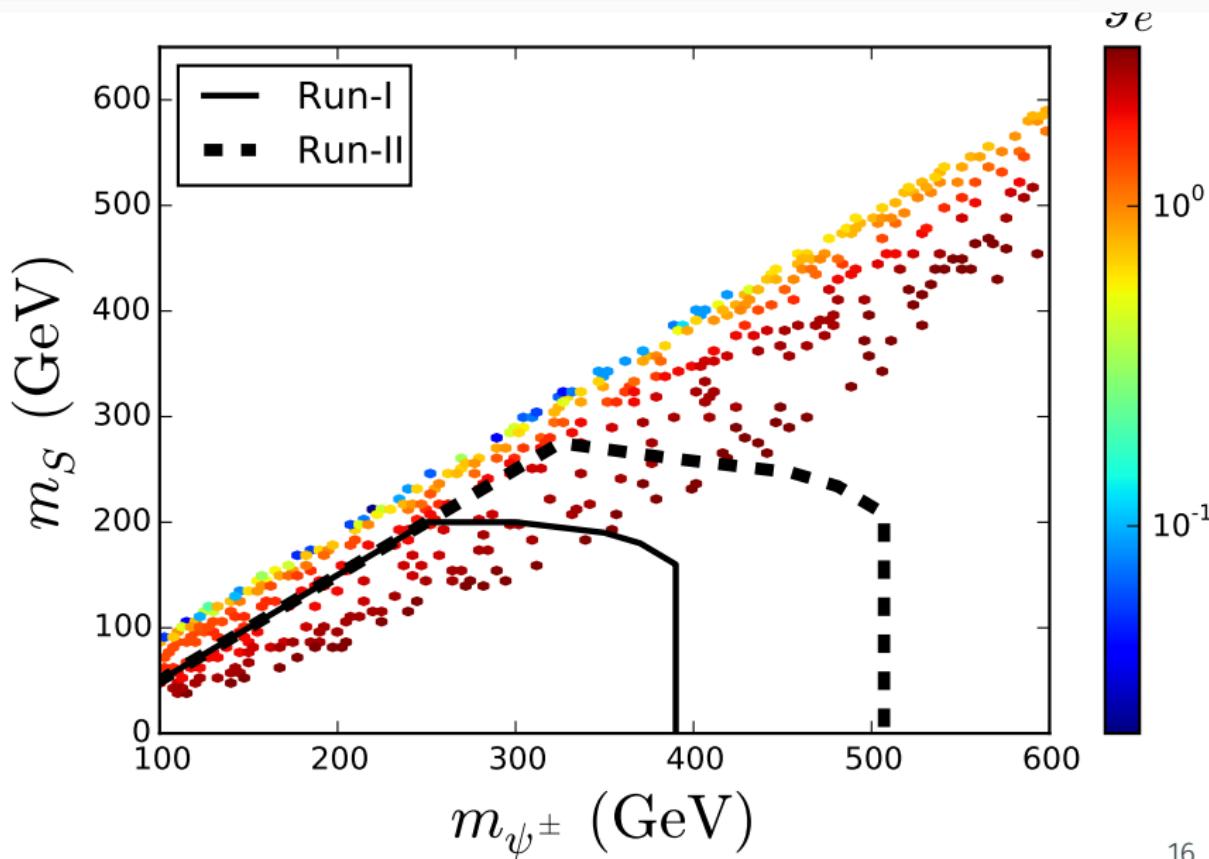

Straightforward way to avoid DD constraints in scalar dark matter:

Name	Symbol	SU(3) _c	SU(2) _L	U(1) _Y	Z ₂
$\begin{pmatrix} \nu_L & e_L \end{pmatrix}^T$	$\begin{pmatrix} \xi_{1\alpha} & \xi_{2\alpha} \end{pmatrix}^T$	1	2	-1/2	+1
$(e_R)^\dagger$	η_1^α	1	1	+1	+1
$(\psi_R)^\dagger$	η_2^α	1	1	+1	-1
ψ_L	$\xi_{3\alpha}$	1	1	-1	-1
S		1	1	0	-1

$$\mathcal{L} \supset y_e S (e_R)^\dagger \psi_L + m_{\psi^\pm} (\psi_R)^\dagger \psi_L + \text{h.c} + \frac{1}{2} m_S S^2 + \lambda_{HS} S^2 H^\dagger H$$

See: arXiv:1307.6181 and arXiv:1307.6480

LHC constraints: Preliminary

Conclusions

Opposite sign *dilepton plus missing transverse energy signal at LHC*

The use of scotogenic models to interpret *dilepton plus missing transverse energy* searches, allow for larger sensitivities and full lepton flavor exploration

Additional motivation for fermion vectorlike mediation with zero *three-level direct detection* cross section and challenging compressed spectra.

Thanks!
